NEXTGEN AUTONOMOUS WORKFORCE

Complete New PC Setup & Operator's Deployment Manual

VERSION: 2.4.0 (Enterprise)
BUILD: Production Release
PLATFORM: Windows 10 / 11 (x64)

> **Autonomous Workforce Suite Overview:** Nextgen is a high-performance, human-grade autonomous automation engine. It combines three professional domains: **Software Engineering (VS Code)**, **Financial Modeling (MS Excel)**, and **Web Exploration (Browsers)** governed by a dynamic stochastic lottery, sub-30ms human handover, and zero-trust hardware-bound licensing.

1. What to Download & Where to Get It (Prerequisites)

If you are deploying this engine onto a **brand new machine**, you do not need complex SDKs. Simply download the following standard Windows software:

Software Component	Official Download URL	Crucial Installation Notes
Python 3.12 (64-bit) `CRITICAL REQUIRED`	`https://www.python.org/downloads/windows/` (Select: *Windows installer 64-bit*)	**MUST CHECK:** On the very first installer screen, you **MUST** check the box: `[X] Add python.exe to PATH`.
Ring-0 Interception Driver `REQUIRED FOR UNDETECTABILITY`	Bundled in project folder under: `Interception/command line installer/` Or GitHub: `github.com/oblitum/Interception`	Extracts kernel filter driver (`keyboard.sys` & `mouse.sys`). Ensures zero synthetic injected flags (`LLKHF_INJECTED = 0`). Requires 1-time reboot.
Microsoft Excel `FOR FINANCIAL ENGINE`	Microsoft Office 365 / Office 2021 / 2019 / 2016	Pre-installed on target PC. Open Excel once to dismiss initial welcome dialogs.
Visual Studio Code `FOR CODING ENGINE`	`https://code.visualstudio.com/Download`	Check *"Add to PATH"* during installation. Workspaces are autonomously scaffolded in `%USERPROFILE%/Desktop/coding_projects`.
Web Browsers `FOR WEB RESEARCH`	Any or all of: **Firefox**, **Brave**, **Chrome**, or native **Edge**	Pre-installed or downloaded from official browser sites. The engine automatically detects and foregrounds your chosen browser.

2. Hardware Ring-0 Interception Driver Setup (One-Time)

The Interception kernel driver guarantees that all keyboard typing and mouse movement are executed directly at the physical USB hardware bus level, completely indistinguishable from a human operator.

> **Administrator Privilege Required for Driver:** Driver installation requires one-time Administrator rights. Subsequent execution of the bot runs under standard user permissions.

1. Press the **Windows Key**, type `cmd`, right-click **Command Prompt**, and select **Run as administrator**.
2. Navigate to the Interception installer folder inside your project directory:

```
cd /d "C:\Path\To\NextgenWorkforce\Interception\Interception\command line installer"
```

3. Execute the kernel installer:

```
install-interception.exe /install
```

4. You will see: `Interception successfully installed. You must reboot for it to take effect.`
5. **Restart your PC** to bind the filter driver to physical HID devices.

3. Step-by-Step New PC Deployment (Two Easy Methods)

You can launch the workforce engine using either the **Ultra-Fast Native Host** (recommended) or the **Standalone Binary**.

Method A: Ultra-Fast Native Host (Recommended - 1-Click Setup)

> **Why Method A is Best:** Uses external dependencies in Python, boots in 0.05 seconds, uses 0 temporary folder extractions, and never triggers antivirus false positives.

1. Copy or unzip the `NextgenWorkforce` project folder to any location on the target PC (e.g. `C:\NextgenWorkforce` or directly on your `Desktop`).
2. Double-click `setup_new_pc.bat`. This automated installer will:
   - Verify your Python 3.12 installation.
   - Automatically install all required packages (`pywin32`, `pynput`, `requests`, `psutil`, `Pillow`).
   - Verify `interception.dll` presence.
   - Compile the native 4 KB `Nextgen.exe` host launcher.
   - Generate a convenient **Desktop Shortcut**: `Nextgen Autonomous Workforce`.
3. Double-click the **Desktop Shortcut** or run `start_workday.bat`!

Method B: Standalone Single-File Executable

If you prefer running a single self-contained executable file:

1. Ensure `Nextgen_Workforce.exe` is placed in your project directory alongside `interception.dll`.
2. Double-click `Nextgen_Workforce.exe`.

4. First-Time Launch & Zero-Trust Hardware License Activation

The engine enforces strict Zero-Trust hardware-bound licensing. Each product key can only be activated on **one specific machine**.

> **3-Step Suicide Guard:** You have 3 attempts to enter a valid product key. Entering 3 invalid keys triggers a detached suicide sequence that permanently purges the binary from the computer.

1. Upon initial launch, the Security Gate displays your machine's unique **Hardware ID (HWID)**:

```
================================================================================
              NEXTGEN AUTONOMOUS WORKFORCE ENGINE - SECURITY GATE
================================================================================
  [DEVICE HARDWARE ID] : NX-B771-59CA-1E24-353D
  [STATUS]             : UNLICENSED (Hardware-Bound Product Key Required)
  [ATTEMPTS REMAINING] : 3 of 3
  >> Enter Product Key (e.g. NX-XXXX-XXXX-XXXX-XXXX):
```

2. Type your 16-character license key (e.g. `NX-4K5L-6M7N-8P9Q`) and press **Enter**.
3. The engine contacts the Supabase Zero-Trust Security Server via encrypted HTTPS.
4. Once verified, a local cryptographic certificate signed with HMAC-SHA256 is created in `%APPDATA%\NextgenWorkforce\license.sig`.
5. **Subsequent launches require no internet**: The engine validates against the local hardware signature instantly!

5. Interactive Workload Selection & Dynamic Quotas

Once authenticated, the master interactive configuration menu appears:

Profile Option	Engine Workloads Included	Dynamic Probability Quota
[1] Full Workday Tri-Engine (Default)	Coding + Excel + Web Browsing	**Coding 70% | Excel 20% | Web 10%**
[2] Production Engineering	Coding + Excel (No Web)	**Coding 77.8% | Excel 22.2%** (Browser prompt skipped)
[3] Pure Software Engineering	VS Code Multi-File Blueprints Only	**Coding 100%**
[4] Pure Financial Modeling	MS Excel Workbooks Only	**Excel 100%**
[5] Pure Web Research	Browser Exploration Only	**Web 100%**
[6] Custom Workload Matrix	User toggles individual engines	Quotas automatically re-normalize to 100% proportionally

Hardware-Seeded Machine Isolation & Disjoint Task Partitioning

To ensure that multiple PCs running the workforce suite never perform duplicate actions or write to identical directories, the engine dynamically partitions tasks using the machine's **Hardware ID (HWID)**:

- **Unique Root Directories:** Each PC automatically namespaces its workspaces on Desktop (e.g. `Desktop\DevWorkspace_B771\` on Machine A vs `Desktop\DevWorkspace_4K5L\` on Machine B).
- **Salted Subfolders & Filenames:** Software blueprints and Excel workbooks adopt unique salted names (e.g. `corporate_pnl_B771.xlsx` vs `corporate_pnl_4K5L.xlsx`).
- **Disjoint Task Permutations:** The 20 coding architectures and 8 Excel models are shuffled deterministically per PC. Two machines running side-by-side will never type the same code or edit the same model simultaneously.
- **Shared Web Exploration Vault:** The 220+ URL Master Vault is shared across all machines with stochastic anti-repetition memory buffer.

6. Operating Controls & Non-Maskable Human Priority (IRQ 0)

The workforce engine operates under a strict **Shared PC Resource Model**. The human user always possesses absolute, non-maskable priority.

Safety & Handover Feature	Trigger Mechanism	System Response
Sub-30ms Mouse Yield	Move mouse > 25px in any direction	Bot releases all virtual keys, halts automation, and yields full control in < 30ms.
Instant Click Handover	Physical Left, Right, or Middle click	Instantly clears automation state. You have immediate mouse authority.
Dedicated Pause / Resume Key	Press `[PAUSE]` or `[F8]`	Dedicated hardware key toggles automation on and off instantly without touching console.
Emergency Escape Halt	Double-tap `[ESC]`	Emergency killswitch immediately cleans input buffer and terminates active task.
Dynamic Cognitive Breaks	End of every task session	Worker rests for **4 to 5 minutes** (240s–300s, never static) with natural mouse drift. Yields instantly if human touches input.
Automatic Inactivity Resume	2 minutes unbroken idle	After human finishes using the PC, bot automatically resumes when 120s of unbroken inactivity is detected.
Instant Manual Start	Press `[ENTER]` in console	Bypasses the 2-minute idle countdown to start a task immediately on demand.

7. Diagnostic & Startup Crash Logger

The engine features a multi-layer diagnostic supervisor. If an error occurs on a new PC, the console window **never closes instantly**.

- **Fail-Safe Console Pause:** On any unhandled startup error or missing package, the launcher prints the full error to the screen and prompts: `[PAUSED] Press ENTER to close this window...`, allowing you to read the diagnostic information.
- **Dual Crash Logs:** Tracebacks are saved to:
  - Local directory: `startup_crash.log` and `Nextgen_Workforce.log`
  - System AppData: `%APPDATA%\NextgenWorkforce\startup_crash.log`
- **Automatic Pre-Flight Check:** If packages are missing, the launcher prints the exact pip install command required rather than throwing obscure errors.

8. Quick Reference Card (Cheat Sheet)

> **Daily Operator Workflow:**
>
> 1. Double-click the **Nextgen Autonomous Workforce** desktop shortcut.
> 2. Select profile: Press `1` for Full Workday (Coding 70% | Excel 20% | Web 10%).
> 3. Select browser (Firefox, Brave, Chrome, or Edge).
> 4. Press `1` for Immediate Start.

5. Use your PC normally at any time — moving the mouse or pressing `[PAUSE]` / `[F8]` yields the computer to you instantly!
